RESTful Booker API test report
Recommendations

Negative Authentication Tests

Instead of returning a *200 / Success* code with an error message, it's recommended to return a corresponding response code *401 / Unauthorised*.

Booking Deletion Test

When booking is deleted, a misleading *201 / Created* code is returned. It is advised to use *200 / Success* one.

Booking Creation Test

It would be better if booking creation endpoint would return *201 / Created* upon success instead of generic *200 / Success*.

Ping Test

Makes more sense to return *200 / Success* rather than *201 / Created* as no new object gets created upon health check ping request.
